

Blue Screen Systems

Computer and Network Solutions Business

Network Planning and Implementation

In today's modern office, implementing a network requires expertise and knowledge of the latest equipment and software available to help you share information and resources.

Blue Screen Systems provides the expertise for the design, implementation and support of the right network for your office.

Our complete network services include: file and print servers, web and mail servers, remote access servers, security routers and more.

We can configure systems to handle all of your company's internet needs, provide Virtual Private Networking to securely connect remote offices and telecommuters.

We will work with you to design and implement your network, creating the right solution for your business.

Wireless Networking

For small organizations that don't have large IT staffs, keeping a growing company "wired" can be costly. With wireless local-area network (WLANs), employees have freedom of movement and always be connected.

We can not only set up your wireless network, but will be able to secure it against unauthorized access. We will also do a wireless audit to ensure good signal strength and complete coverage of your work place.

Data Backup and Recovery

Data backup solutions include on-site automated back-up using conventional tape drives or optical discs. **Blue Screen Systems** provides secure, online, remote data backup solutions for businesses and home offices. The automatic data backups can be performed 24 hours a day. Each data backup is compressed and encrypted on your PC and then stored offsite on our secure remote backup servers.

Disaster recovery planning must form part of any data backup plan. These systems and plans must be tested to ensure that you can recover from a data loss incident. Don't wait for a data loss incident to find out that your back-up drive does not work.

Notebook Data Backup

Notebook computers are the perfect tool for busy on-the-go employees -- powerful, compact and portable.

But those same attributes make them the most vulnerable to a variety of data loss risks. With tiny components and connections packed in a compact case, laptops are delicate and can easily overheat, suffer hard drive failures or power outages, making the data they store extremely vulnerable. Laptops are also frequently dropped and damaged, lost or stolen from cars, airports, offices and homes.

Coupled with the extreme vulnerability of laptops is the disturbing fact that most users don't store their data on a centralized server, and rarely, if ever, back up their hard drive.

Blue Screen Systems provides reliable and easy solutions for getting mobile notebook users to perform regular backups.

Network Support

This includes performance monitoring, problem solving, network maintenance and support desk operation. We can maintain your computer network to reduce computer network downtime.

Desktop Support

Blue Screen Systems can maintain your desktop computers to reduce downtime. Services include remote desktop support, system repair and upgrades and maintenance to all brands of computer equipment.

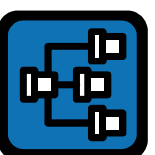

Security Management

These services include installing, configuring and maintaining firewalls, DMZ, corporate anti-virus solutions, encryption, authentication and site security analyses. Our security tools and services will protect both your wired and wireless networks.

Knowledge. Service. Reliability
